S10 17 Dec
Showtime

Each session: 35 + 5 + 35 minutes.

Why Python for supply chain

Big files

Excel slows down when the file gets large.

Repeat work

One click runs the weekly steps again.

Show your work

Every step stays visible for your manager.

A five-minute tour of Colab

1. **Open**
   The notebook in Drive
2. **Text or code**
   Click a cell to see
3. **Run**
   Shift and Enter
4. **Order**
   Run from the top

print shows a value, a variable keeps it

IN DAILY LIFE

A label on a storage bin.

IN EXCEL

A named cell.

THE LIMIT

Nothing shows unless you ask.

```
product_name = "WHITE HANGING HEART T-LIGHT HOLDER"
quantity = 6
print(product_name)
print(quantity)
```

Numbers and text are different types

IN DAILY LIFE

Counting boxes, weighing goods, a product name.

IN EXCEL

Number format or text format.

THE LIMIT

"5" is text. Python will not add it to a number.

```
quantity = 6
unit_price = 2.55
print(type(quantity))
print(type(unit_price))
print(type(product_name))
```

Multiply, round, then write the sentence

IN DAILY LIFE

Adding up a receipt.

IN EXCEL

=B2*C2 and ROUND.

THE LIMIT

6 * 2.55 prints 15.299999999999999.
Round money.

```
sales_value = quantity * unit_price
print(sales_value)
print(round(sales_value, 2))
print(f"{quantity} units: {round(sales_value, 2)} pounds")
```

Three errors you will meet

Error	What it means
NameError	The name is not defined
SyntaxError	A bracket or quote is missing
TypeError	Text plus a number

Read the last line first. It names the error.

Now in Colab

Notebook	s1_hello_python.ipynb
Homework	Worksheet, then make the three errors
Recall	Three questions for Tuesday
